## Homework Assignment 12 <br> Due on Friday 12/28

## Programming Problems:

1. Write a Matlab code that solves

$$
y(a)=\alpha, \quad y^{\prime}(t)=f(t, y) \quad \forall t \in[a, b]
$$

by using Euler's method. Your code should take $a, b, h, f, \alpha$ as inputs and return $w_{i}$ as outputs, where $h$ is the step size and $w_{i}$ is an approximation for $y_{i}$.

Save your code as function M-file and submit it to num_ana@math.nthu.edu.tw

## Writing Problems:

Do the following exercise problems in the text book by Bradie,
Sec 7.1: $1(\mathrm{a}, \mathrm{b}, \mathrm{e}), 2(\mathrm{a}, \mathrm{d}), 3^{*}(\mathrm{~b}, \mathrm{~d}), 4,6^{*}, 7^{*}, 8^{*}$
Sec 7.2: $1,4^{*}, 9^{*}, 13,17^{*}, 20,23^{*}$
We only discuss * problems in discussion section.
