

## Brief answers to Midterm 2

May 16, 2016

Show all details. Problem 1-8: 12 pts each. Problem 9-10: 10 pts each. Total 116 points.  
(average score = 58.2 pts)

1. True or False? Prove it if true. Give a counter example if false.

If  $f(x, y)$  is differentiable at  $(0, 0)$ , then  $f(x, y)$  is continuous at  $(0, 0)$ .

Remark: partial credits for at least writing correct definitions.

**Answer. (average score = 3.81/12 pts: 31.8%)**

True. (2 pts)

Definitions: see p774 and p790 (equivalent definitions also acceptable). (5 pts)

proof:

Since  $f$  is differentiable at  $(0, 0)$ , both  $f_x(0, 0)$  and  $f_y(0, 0)$  exist and

$$f(x, y) - f(0, 0) = f_x(0, 0)x + f_y(0, 0)y + \epsilon_1x + \epsilon_2y$$

where  $\epsilon_1, \epsilon_2 \rightarrow 0$  as  $(x, y) \rightarrow (0, 0)$

$$\Rightarrow |f(x, y) - f(0, 0)| = |f_x(0, 0)||x| + |f_y(0, 0)||y| + |\epsilon_1||x| + |\epsilon_2||y| \rightarrow 0 \text{ as } (x, y) \rightarrow (0, 0).$$

therefore  $f$  is continuous at  $(0, 0)$  (5 pts).

2. Evaluate

$$\frac{d}{dy} \int_1^{2+y^2} \frac{\cos(xy)}{x} dx.$$

**Answer. (average score = 3.25/12 pts: 27.1%)**

Let  $G(y, z) = \int_1^z \frac{\cos(xy)}{x} dx$ . We need to compute

$$\frac{d}{dy} G(y, 2 + y^2) = G_y(y, 2 + y^2) + G_z(y, 2 + y^2) \cdot 2y \text{ (8pts)}$$

$$= - \int_1^{2+y^2} \sin(xy) dx + \frac{\cos((2 + y^2)y)}{2 + y^2} \cdot 2y \text{ (2 pts)}$$

$$= \frac{1}{y} (\cos((2 + y^2)y) - \cos y) + \frac{\cos((2 + y^2)y)}{2 + y^2} \cdot 2y. \text{ (2pts)}$$

Answer only without derivation: either 0 pts or 12 pts.

3. Find the equation of plane normal to the following curve at  $(1, -1, 1)$

$$\begin{cases} x^2 + 2y^2 + 3z^2 = 6 \\ x + y + z = 1 \end{cases}$$

**Answer. (average score = 8.38/12 pts: 69.8%)**

First compute the two gradients at  $(1, -1, 1)$

$$(2x, 4y, 6z)|_{(1,-1,1)} = (2, -4, 6) \text{ (2 pts)}$$

and

$$(1, 1, 1)|_{(1,-1,1)} = (1, 1, 1). \text{ (2 pts)}$$

The normal vector of the plane is parallel to the outer product of these two gradients:

$$n = \begin{vmatrix} i & j & k \\ 1 & 1 & 1 \\ 1 & -2 & 3 \end{vmatrix} = (5, -2, -3). \text{ (4 pts)}$$

Therefore, the equation of the plane is

$$5(x - 1) - 2(y + 1) - 3(z - 1) = 0. \text{ (4 pts)}$$

4. Show that, for any  $a \in \mathbb{R}$ , the point  $(x_0, y_0) = (0, 0)$  is a critical point of the function

$$f_a(x, y) = (a - 1)(x + y)^2 + (a + 1)(x - 2y)^2.$$

For what values of  $a$  is the point  $(0, 0)$  a local minimum, a local maximum and a saddle point, respectively?

**Answer. (average score = 8.62/12 pts: 71.8%)**

Method.1 For  $a \geq 1$ ,  $f_a(x, y) = (a - 1)(x + y)^2 + (a + 1)(x - 2y)^2$  is a sum of two squares. And  $(0, 0)$  admits the minimum 0. **(4 pts)**

For  $-1 < a < 1$ ,  $f_a(x, y) = (a + 1)(x - 2y)^2 - (1 - a)(x + y)^2$  is a difference of two squares. And  $(0, 0)$  is a saddle point since  $f_a(1, -1) = 9(a + 1) > 0$  and  $f_a(2, 1) = -9(1 - a) < 0$ . **(4 pts)**

For  $a \leq -1$ ,  $f_a(x, y) = -[(1 - a)(x + y)^2 + (-1 - a)(x - 2y)^2]$  is the negative of sum of two squares. And  $(0, 0)$  admits the maximum 0. **(4 pts)**

Method.2 First compute the gradient at  $(0, 0)$

$$\nabla f_a(0, 0) = (2(a-1)(x+y)+2(a+1)(x-2y), 2(a-1)(x+y)+2(a+1)(x-2y)(-2))|_{(0,0)} = (0, 0),$$

and thus  $(0, 0)$  is a critical point. **(3 pts)**

Now compute the second derivatives

$$(f_a)_{xx}(0, 0) = 2(a - 1) + 2(a + 1) = 4a,$$

Figure 1: The gradient analysis for problem 5.

$$(f_a)_{yy}(0,0) = 2(a-1) + 8(a+1) = 10a + 6 = 2(5a + 3),$$

and

$$(f_a)_{xy}(0,0) = 2(a-1) - 4(a+1) = -2(a+3).$$

A local minimum occurs as  $(f_a)_{xx} > 0$  and  $(f_a)_{xx}(f_a)_{yy} - (f_a)_{xy}^2 > 0$ , i.e.

$$\begin{aligned} a > 0, \quad 8a(5a+3) - 4(a+3)^2 &= 36(a^2 - 1) > 0 \\ \Leftrightarrow \quad a > 1. \quad \mathbf{(3 \text{ pts})} \end{aligned}$$

A local maximum occurs as  $(f_a)_{xx} < 0$  and  $(f_a)_{xx}(f_a)_{yy} - (f_a)_{xy}^2 > 0$ , i.e.

$$\begin{aligned} a > 0, \quad 8a(5a+3) - 4(a+3)^2 &= 36(a^2 - 1) > 0 \\ \Leftrightarrow \quad a < -1. \quad \mathbf{(3 \text{ pts})} \end{aligned}$$

A saddle point occurs as  $(f_a)_{xx}(f_a)_{yy} - (f_a)_{xy}^2 < 0$ , i.e.

$$\begin{aligned} 8a(5a+3) - 4(a+3)^2 &= 36(a^2 - 1) < 0 \\ \Leftrightarrow \quad -1 < a < 1. \quad \mathbf{(3 \text{ pts})} \end{aligned}$$

For  $a = 1$ ,  $f_a(x, y) = 2(x - 2y)^2$ . And thus  $(0, 0)$  admits a local minimum.

For  $a = -1$ ,  $f_a(x, y) = -2(x + y)^2$ . And this  $(0, 0)$  admits a local maximum.

Getting the two equalities  $a = \pm 1$  correctly: **(extra 2 pts)**.

5. Find absolute maxima and minima of  $f(x, y) = x^2 + xy + y^2 - 6x$  on the rectangular domain  $0 \leq x \leq 5$ ,  $-3 \leq y \leq 0$ .

**Answer. (average score = 9.18/12 pts: 76.4%)**

First find the gradient:

$$\nabla f(x, y) = (2x + y - 6, x + 2y). \quad \mathbf{(2 \text{ pts})}$$

Therefore one can plot the gradients as in figure 1. From the plot it is easy to see that  $f(4, -2) = -12$  is the only local minimum since there is no local minimum on the boundary (**3 pts**). Therefore  $f(4, -2) = -12$  is also the absolute minimum (**2 pts**).

Moreover, the local maximum consists of the three corners  $(0, -3)$ ,  $(5, -3)$  and  $(5, 0)$ . Upon comparing the values of  $f$  on the corners  $(0, -3)$ ,  $(5, -3)$  and  $(5, 0)$  it follows that the absolute maxima is  $f(0, -3) = 9$  (**5 pts**).

6. Use the method of Lagrangian multiplier (this method only) to find the point closest to the origin on the curve of intersection of the plane  $2y + 4z = 5$  and the cone  $z^2 = 4x^2 + 4y^2$ .

**Answer. (average score = 6.93/12 pts: 57.8%)**

Minimize  $f(x, y, z) = x^2 + y^2 + z^2$ , subject to the constraints

$$g_1(x, y, z) = 2y + 4z - 5 = 0, \quad g_2(x, y, z) = 4x^2 + 4y^2 - z^2 = 0. \quad (\mathbf{3 \text{ pts}})$$

$$\begin{cases} \nabla f = \lambda_1 \nabla g_1 + \lambda_2 \nabla g_2 \\ g_1(x, y, z) = 0 \\ g_2(x, y, z) = 0. \end{cases} \Rightarrow \begin{cases} 2x = \lambda_2 8x \\ 2y = \lambda_1 2 + \lambda_2 8y \\ 2z = \lambda_1 4 + \lambda_2 (-2z) \\ 2y + 4z - 5 = 0 \\ 4x^2 + 4y^2 - z^2 = 0. \end{cases} \quad (\mathbf{3 \text{ pts}})$$

**case 1:**

$\lambda_2 = 1/4$ , no solution.

**case 2:**

$x = 0$ ,  $(y, z) = (1/2, 1)$  or  $(-5/6, 5/3)$ . Compare values of  $f$  on these two points: minimum occurs when  $(x, y, z) = (0, 1/2, 1)$ . Shortest distance =  $\sqrt{5}/2$  (**6 pts**).

7. Derive Taylor's formula for  $f(x, y)$ , assuming all partial derivatives of any order of  $f$  are continuous. Find a quadratic approximation of  $f(x, y) = \ln(2x + y + 1)$  near the origin.

**Answer. (average score = 5.01/12 pts: 41.7%)**

Derivation: page 840 of the textbook (**6 pts**).

Quadratic approximation:

$$f_x(x, y) = \frac{2}{1 + 2x + y}, \quad f_y(x, y) = \frac{1}{1 + 2x + y}, \quad (\mathbf{1 \text{ pts}})$$

$$f_{xx}(x, y) = \frac{-4}{(1 + 2x + y)^2}, \quad f_{xy}(x, y) = \frac{-2}{(1 + 2x + y)^2}, \quad f_{yy}(x, y) = \frac{-1}{(1 + 2x + y)^2} \quad (\mathbf{1 \text{ pts}})$$

$$\begin{aligned} Q(x, y) &= f(0, 0) + f_x(0, 0)x + f_y(0, 0)y + \frac{1}{2}(f_{xx}(0, 0)x^2 + 2f_{xy}(0, 0)xy + f_{yy}(0, 0)y^2) \\ &= 0 + 2x + y - \frac{1}{2}(4x^2 + 4xy + y^2) \quad (\mathbf{4 \text{ pts}}) \end{aligned}$$

8. Evaluate

$$\int_0^2 \int_y^2 x^2 \cos(xy) \, dx dy$$

**Answer.** (average score = 7.32/12 pts: 61.0%)

$$\begin{aligned} \int_0^2 \int_y^2 x^2 \cos(xy) \, dx dy &= \int_0^2 \int_0^x x^2 \cos(xy) \, dy dx \quad (\mathbf{6 \text{ pts}}) \\ &= \int_0^2 x \sin(xy) \Big|_0^x \, dx \\ &= \int_0^2 x \sin(x^2) \, dx \quad (\mathbf{3 \text{ pts}}) \\ &= -\frac{1}{2} \cos(x^2) \Big|_0^2 = -\frac{1}{2}(\cos 4 - 1). \quad (\mathbf{3 \text{ pts}}) \end{aligned}$$

9. Find the Taylor series generated by  $\sin^{-1} x$ , centered at 0.

Hint: what is  $\frac{d}{dx} \sin^{-1} x$ ?

**Answer.** (average score = 3.83/10 pts: 38.3%)

$$\begin{aligned} \sin^{-1} x &= \int_0^x (1 - t^2)^{-\frac{1}{2}} dt \quad (\mathbf{2 \text{ pts}}) = \\ &= \int_0^x \left( 1 - \frac{1}{2}(-t^2) + \frac{\frac{1}{2} \cdot \frac{3}{2}}{2!}(-t^2)^2 - \frac{\frac{1}{2} \cdot \frac{3}{2} \cdot \frac{5}{2}}{3!}(-t^2)^3 + \dots + (-1)^n \frac{\frac{1}{2} \cdot \frac{3}{2} \cdot \dots \cdot \frac{2n-1}{2}}{n!} (-t^2)^n + \dots \right) dt \quad (\mathbf{5 \text{ pts}}) \\ &= x + \frac{1}{2} \frac{x^3}{3} + \frac{1}{2} \cdot \frac{3}{4} \cdot \frac{x^5}{5} + \frac{1}{2} \cdot \frac{3}{4} \cdot \frac{5}{6} \cdot \frac{x^7}{7} + \dots + \frac{1}{2} \cdot \frac{3}{4} \cdot \dots \cdot \frac{2n-1}{2n} \cdot \frac{x^{2n+1}}{2n+1} + \dots \quad (\mathbf{3 \text{ pts}}) \end{aligned}$$

10. Evaluate  $\sum_{n=0}^{\infty} \frac{x^n}{n+2}$  on  $|x| < 1$  using computational rules of power series.

**Answer.** (average score = 1.98/10 pts: 19.8%)

The value is  $1/2$  as  $x = 0$ . (**2 pts**). For  $x \neq 0$ ,

$$\begin{aligned} \sum_{n=0}^{\infty} \frac{x^n}{n+2} &= x^{-2} \left( \sum_{n=0}^{\infty} \frac{x^{n+2}}{n+2} \right) \\ &= x^{-2} \left( \sum_{n=0}^{\infty} \int_0^x t^{n+1} dt \right) \quad (\mathbf{3 \text{ pts}}) \\ &= x^{-2} \left( \int_0^x \sum_{n=0}^{\infty} t^{n+1} dt \right) \\ &= x^{-2} \left( \int_0^x \frac{t}{1-t} dt \right) \quad (\mathbf{3 \text{ pts}}) \\ &= x^{-2} (-x - \ln(1-x)) = -\frac{1}{x} - \frac{\ln(1-x)}{x^2}. \quad (\mathbf{2 \text{ pts}}) \end{aligned}$$
