## Study Guide for Chap 08

Coverage: Sections 8.1-8.4, 8.7.

- 1. List all techniques of integrations (don't forget the 'half-angle' substitution  $z = \tan(x/2)$ ), create a few examples for each of them and then solve. Then go through problems 69-116 on page 509 as a final review.
- 2. Study and memorize the convergence/divergence of  $\int_0^a x^{-p} dx$  and  $\int_a^\infty x^{-p} dx$  for the cases 0 , <math>p = 1 and p > 1, respectively. Here *a* is an arbitrary positive number. The exact value of a > 0 is not important (why?).
- 3. Which comparison Theorems can be used to decide convergence/divergence of improper integrals?
- 4. How to determine convergence/divergence of an improper integral if it has multiple 'improper' parts such as the domain contains both  $x \to \pm \infty$ , and/or several points of discontinuity within the domain?
