Calculus II, Spring 2019 (http://www.math.nthu.edu.tw/~wangwc/)

Homework Assignment for Week 11

1. Section 14.7: Problems 31, 35, 43, 44.

Hint: You can use the method of gradient analysis introduced in 190430's class. That is, plot the gradient vector ∇f near a critical point to determine whether the critical point is a local minimum, local maximum or neither.

- 2. Section 14.8: Problems 1, 23, 27, 33, 35.
- 3. Section 14.9: Problems 7, 9, 10, 11.

Hint: An alternative method for problem 9, 10: try Taylor's formula for $\frac{1}{1-z}$ with appropriate choice of z. For problem 11: read example 1 in page 840.

4. Section 14.9:

Taylor's formula for functions of 2 variables can be summarized as

$$f(x_0 + \Delta x, y_0 + \Delta y) = f(x_0, y_0) + \sum_{k=1}^n \frac{1}{k!} \left(\Delta x \partial_x + \Delta y \partial_y \right)^k f(x_0, y_0)$$
$$+ \frac{1}{(n+1)!} \left(\Delta x \partial_x + \Delta y \partial_y \right)^{n+1} f(x_0 + c\Delta x, y_0 + c\Delta y), \quad 0 < c < 1.$$

(Note: the textbook uses the notations a, b, h, k in place of $x_0, y_0, \Delta x, \Delta y$). Derive a similar formula for functions of 3 variables. Then use it to derive the error estimate $|E| < \cdots$ in page 816 (section 14.6).

5. Section 14.9:

Use Taylor's formula for 2 variables to derive the formula $\Delta f = \Delta_1 + \Delta_2 + \Delta_3$ on page 5 of mse19s_190425.pdf.
