

Recall definition of limit:

$$\lim_{n \rightarrow \infty} a_n = L$$

$(+\infty)$

For every $\varepsilon > 0$
($M \in \mathbb{R}$),
there exists a corresponding
integer N , such that

for all $n > N$,

we have $|a_n - L| < \varepsilon$

$(a_n > M)$

$$\text{Eg 1: } \lim_{n \rightarrow \infty} \frac{1}{n} = ?$$

"Eg" = "Example"

$$\text{Ans: } L = 0$$

∴ For any $\epsilon > 0$

$$\text{Take } \underline{N} = \left[\frac{1}{\epsilon} \right] + 1 \Rightarrow \frac{1}{N} < \epsilon$$

∴ (or take any $N > 1/\epsilon$)

$$n > N \Rightarrow |a_n - 0| < \epsilon$$

$$\therefore |a_n - 0| = \frac{1}{n} < \frac{1}{N}$$

$$\frac{1}{N} < \frac{1}{\epsilon} = \epsilon$$

#

$$\text{Eg 2: } \lim_{n \rightarrow \infty} n^2 = +\infty$$

pf:

For any $M \in \mathbb{R}$

(may assume $M > 0$)

$$\text{Take } N = \lceil \sqrt{M} \rceil + 1 > \sqrt{M}$$

(or take any $N > \sqrt{M}$)
 \Rightarrow for all $n > N$,

we have

$$a_n > a_N > \sqrt{M}^2 = M$$

\parallel
 n^2 \parallel
 N^2

$$\text{Eg 3 } \{a_n\} = \{1, -1, 1, -1, \dots\}$$

$$(a_n = (-1)^{n-1})$$

$\Rightarrow \{a_n\}$ diverges

($\neq \pm \infty$)

$$\text{Eg 4. } \{a_n\} = \{1, 0, 2, 0, 3, 0, \dots\}$$

$$\lim_{n \rightarrow \infty} a_n \neq \begin{matrix} +\infty \\ -\infty \end{matrix}$$

any $L \in \mathbb{R}$

$\{a_n\}$ diverges

How to find $\lim_{n \rightarrow \infty} a_n$?

(I): Apply Sandwich
Theorem for sequences

(Section 10.1, Theorem 2)

Eg 5: $\lim_{n \rightarrow \infty} \frac{\cos n}{n}$

Sol: $-\frac{1}{n} \leq \frac{\cos n}{n} \leq \frac{1}{n}$

$\lim_{n \rightarrow \infty} \frac{-1}{n} = 0 = \lim_{n \rightarrow \infty} \frac{1}{n}$

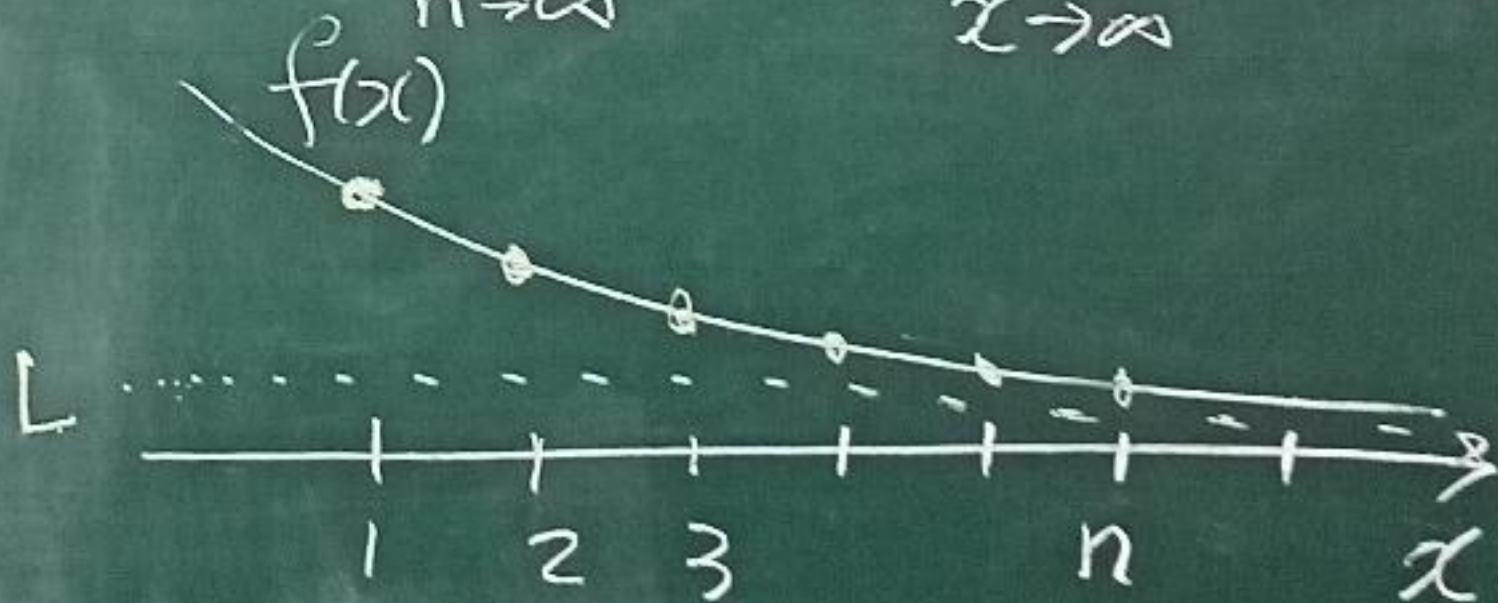

Sandwich Thm $\implies \lim_{n \rightarrow \infty} \frac{\cos n}{n} = 0$

(Section 10.1, Theorem 4)

(II): Thm: Suppose $f(x)$ is a function defined for all $x \geq N_0$ with $a_n = f(n)$

and $\lim_{x \rightarrow \infty} f(x) = L$
($\pm \infty$)

then $\lim_{n \rightarrow \infty} a_n = \lim_{x \rightarrow \infty} f(x)$

$$\text{Eg 7: } \lim_{n \rightarrow \infty} \frac{\ln n}{n} = ?$$

$$\text{Ans: } \frac{\infty}{\infty} \quad (\text{Ans} = 0)$$

$$\text{Find } \lim_{x \rightarrow \infty} \frac{\ln x}{x} = ?$$

(Here $x \in \mathbb{R}$, $x > 0$)

$$\text{i.e. } f(x) = \frac{\ln x}{x}$$

L'Hopital Rule:

$$\begin{aligned} \lim_{x \rightarrow \infty} \frac{\ln x}{x} &= \lim_{x \rightarrow \infty} \frac{(\ln x)'}{x'} \\ &= \lim_{x \rightarrow \infty} \frac{1}{1} = 0 \therefore \lim_{n \rightarrow \infty} \frac{\ln n}{n} = 0 \end{aligned}$$

(Memorize this result)

$$\text{Ex 8 } \lim_{n \rightarrow \infty} n^{\frac{1}{n}} = ?$$

(Ans = 1)

$$= \lim_{n \rightarrow \infty} \left(e^{\ln n} \right)^{\frac{1}{n}}$$

$$= \lim_{n \rightarrow \infty} e^{\frac{\ln n}{n}}$$

(Theorem 3)

$$= e^{\lim_{n \rightarrow \infty} \left(\frac{\ln n}{n} \right)} = e^0 = 1$$

$$\uparrow$$
$$x \xrightarrow{f} e^x$$

is a continuous function

ie. $\lim_{x \rightarrow x_0} f(x) = f(x_0)$

$$= f\left(\lim_{x \rightarrow x_0} x\right)$$

Memorize this result

Ex 1. $\lim_{n \rightarrow \infty} \left(1 + \frac{x}{n}\right)^n = ?$ (Ans = e^x)
($x \in \mathbb{R}$ is fixed)

Ans: "1[∞]"

$$= \lim_{n \rightarrow \infty} \left(e^{\ln\left(1 + \frac{x}{n}\right)} \right)^n$$

$$= \lim_{n \rightarrow \infty} e^{\left(\frac{\ln\left(1 + \frac{x}{n}\right)}{\frac{1}{n}} \right)}$$

$$= e^{\lim_{n \rightarrow \infty} \left(\frac{\ln\left(1 + \frac{x}{n}\right)}{\frac{1}{n}} \right)}$$

It remains to find

$$\lim_{n \rightarrow \infty} \frac{\ln\left(1 + \frac{x}{n}\right)}{\frac{1}{n}}$$

$$= \lim_{n \rightarrow \infty} \frac{\frac{d}{dn} \left(\ln\left(1 + \frac{x}{n}\right) \right)}{\frac{d}{dn} \left(\frac{1}{n} \right)}$$

$$= \lim_{n \rightarrow \infty} \frac{\frac{1}{1 + \frac{x}{n}} \cdot \left(-x n^{-2} \right)}{-n^{-2}}$$

$$= x$$

$$\therefore \lim_{n \rightarrow \infty} \left(1 + \frac{x}{n}\right)^n = e^x$$

$$\underline{\text{Ex 10}} \quad \lim_{n \rightarrow \infty} \left(\frac{n+1}{n-1} \right)^n$$

$$= \lim_{n \rightarrow \infty} \left(1 + \frac{2}{n-1} \right)^n$$

$$= \lim_{n \rightarrow \infty} \left(1 + \frac{2}{n-1} \right)^{n-1} \cdot \left(1 + \frac{2}{n-1} \right)$$

$$= e^2 \cdot 1 = e^2$$

Infinite Series

$$\text{Def: } \sum_{n=1}^{\infty} a_n = L \quad (\pm \infty)$$

$$\text{if } \lim_{n \rightarrow \infty} S_n = L \quad (\pm \infty)$$

$$\text{where } S_n = \sum_{k=1}^n a_k$$

$$= (a_1 + a_2 + \dots + a_n)$$

$(S_1, S_2, S_3, \dots, S_n, \dots)$
is the sequence of
partial sum of $\{a_k\}$

Eg of Convergent Series

* Geometric Series

$$\sum_{n=0}^{\infty} ar^n = a + ar + ar^2 + \dots + ar^n + \dots$$

$$= \lim_{n \rightarrow \infty} S_n, \quad S_n = \sum_{k=0}^n ar^k$$

$$= \begin{cases} \frac{a}{1-r}, & \text{if } |r| < 1 \\ \text{divergent, if } r = \pm 1 \\ \text{or } |r| > 1 \end{cases}$$

Ex 11. $\sum_{n=1}^{\infty} \frac{3^n + 2^n}{6^n}$

$$= \sum_{n=1}^{\infty} \left(\frac{1}{2}\right)^n + \sum_{n=1}^{\infty} \left(\frac{1}{3}\right)^n = \text{conv.}$$

* Telescoping Sum

$$\text{Eg 12: } \sum_{n=1}^{\infty} \frac{1}{n(n+1)}$$

$$\text{Sol. } S_n = \sum_{k=1}^n \frac{1}{k(k+1)}$$

$$= \sum_{k=1}^n \left(\frac{1}{k} - \frac{1}{k+1} \right)$$

$$= \left(\frac{1}{1} - \cancel{\frac{1}{2}} \right)$$

$$+ \left(\cancel{\frac{1}{2}} - \cancel{\frac{1}{3}} \right)$$

$$+ \dots$$

$$+ \left(\cancel{\frac{1}{n}} - \frac{1}{n+1} \right)$$

$$= 1 - \frac{1}{n+1}, \therefore \lim_{n \rightarrow \infty} S_n = 1$$

Theorem (10.2: Theorem 7)

$$\sum_{n=1}^{\infty} a_n \text{ conv.} \implies \lim_{n \rightarrow \infty} a_n = 0$$

(~~⇐~~)

$$\left(\sum_{n=1}^{\infty} a_n \text{ div.} \leftarrow \lim_{n \rightarrow \infty} a_n \neq 0 \right)$$

pf. Since $a_n = S_n - S_{n-1}$

$$\begin{aligned} \therefore \lim_{n \rightarrow \infty} a_n &= \left(\lim_{n \rightarrow \infty} S_n \right) - \left(\lim_{n \rightarrow \infty} S_{n-1} \right) \\ &= L - L = 0 \end{aligned}$$
